PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/766,882

Applicant(s)

GRECH ET AL.

Examiner

Charles Shedrick

Art Unit

2617

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 29 October 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-16 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-16 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 10/29/07 has been entered.

Response to Arguments

Applicant's arguments filed 10/29/07 have been fully considered but they are not persuasive. With respect to the claim language the Examiner presents the following explanation in an effort to clarify the claim interpretation and the rejection as follows.

2. performing an authentication procedure

The claims recite "performing an authentication procedure", which refers to any part or role involved in at least the authentication method and not necessarily the authentication result. A procedure generally refers to the method rather than the result. The claim further indicates "performing" an authentication procedure which implies being in the act of and not necessarily the completion of. The Examiner respectfully notes that the Applicant assertion of "pre" indicating something that precedes another thing is correct. However, the intention of the Examiner is to communicate that the pre-authentication (i.e., MN-FA challenge extension contained in the ProxyRtAdv which is used for authentication and authorization purposes) is actually considered as the initial phase of "performing" the authentication procedure although it occurs before the authentication "process" is completed.

3. Packet Data Protocol Establishment

The Examiner respectfully notes that a Packet data protocol as discussed herein is interpreted as frame relay, IP, x.25, etc. The claims recite simultaneously "performing a packet data protocol session" (i.e., performing IP, frame relay, X.25, etc. protocol session). The claims do not explicitly claim the PDP context establishment. The abstract (i.e., at least the abstract) recites the ability to prevent the disruption of ongoing internet (e.g., IP) session. Therefore as a basis for operating in an ongoing internet session (i.e., performing a packet data protocol session) and accomplishing a handover to a second network in which an authentication procedure must take place. A careful examination of claim 1 would clearly show that there is nothing the clearly identifies when the data protocol session establishment procedure begins. Accordingly, based on the fact that the internet sessions are "ongoing", one of ordinary skill in the art would recognize the TCP sessions (i.e., packet data) would also be "ongoing (e.g., TCP three way handshake, open connection/closed connection on various ports etc.). The performing of a packet data protocol session establishment procedure is actually occurring simultaneously with the authentication procedure since the claim language opens the invention to any IP (i.e., packet data) session procedure and the authentication procedure would begin at some point during an "ongoing" internet session. The Applicant asserts on page 15 of the remarks that " In Parikh only the pre-authentication process is carried out while still being attached to the first communication network , while in the recitations of claim 1, the pre authentication and the PDP context establishment are carried out while still being attached to the first communication network". It is important that the Applicant notes that nowhere in the claim language is "PDP context establishment" recited. The claim language opens the interpretation to any PDP (e.g., IP,

Art Unit: 2617

FrameRelay) establishment. The Examiner respectfully notes that Applicants repeated assertions of **PDP context** are not explicitly stated in the claims. There are no indications in the claim language that establishes **when** the “performing a packet data protocol session establishment procedure” begins. It appears that the Applicant is arguing that the **PDP context** establishment initiates the PDP establishment, however the claim language does not make the distinction. Again, although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

Regarding claim 10, Parikh describes the Spurious Handoff triggers (e.g., which cause the noted ping pong affect) in section 3.3. e.g., a terminal waiting a short time after the loss of a first network before initiating handoff to a second network. The solution which addresses claims 10 as noted specifically in the previous remarks in section 4.2.1.

Therefore, the rejection is maintained as proper

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

2. Claims 1-15 are rejected under 35 U.S.C. 102(a) as being anticipated by **Parikh et al.**

(see PTO-892 Non-patent Literature section U)

Consider **claim 1**, Parikh et al. teaches the method for ensuring continuity of a communication session when a user equipment hands over from a first communication network

Art Unit: 2617

(i.e., WLAN) to a second communication network (i.e., CDMA2000) comprising: performing an authentication procedure for a packet data session with the second communication network while the user equipment is still connected to the first communication network (**abstract, introduction, section 4.1 and figure 4**); and simultaneously performing a packet data protocol session establishment procedure with the second communication network while the user equipment still connected to the first communication network (**abstract , introduction, section 4.1 and figure 4**).

Consider **claim 2** and **as applied to claim 1 above**, Parikh et al. teach a method as claimed in claim 1, wherein the performing of the authentication procedure comprises authenticating the second communication network (i.e., the CDMA2000) by the user equipment (i.e., authentication challenge)(**section 4.1 and figure 4**).

Consider **claim 3** and **as applied to claim 2 above**, Parikh et al. teach a method as claimed in claim 2, wherein the step of performing the authentication procedure comprises authenticating the user equipment by the second communication network (i.e., the authentication challenge) (**section 4.1 and figure 4**).

Consider **claim 4** and **as applied to claim 1 above**, Parikh et al. teach a method as claimed in claim 1, further comprising: providing the first communication network comprising a Wireless Local Area Network (WLAN) and the second communication network comprising a cellular network (i.e., CDMA2000)(**section 1**).

Consider **claim 5** and **as applied to claim 1 above**, Parikh et al. teach a method as claimed in claim 1, wherein the performing of the authentication procedure comprises sending information by a user equipment for authentication and packet data session establishment,

Art Unit: 2617

wherein the information travels either as a separate IP package or is piggybacked with existing signaling (**section 4.1 and figure 4**).

Consider **claim 6** and **as applied to claim 1 above**, Parikh et al. teach a method as claimed in claim 1, further comprising: configuring a gateway node (i.e., AR)(**figure 4.1**) between the first communication network and the second communication network to act as an access router for the first communication network and to host the packet data session in the second communication network (**section 4.1 and figure 4**).

Consider **claim 7** and **as applied to claim 1 above**, Parikh et al. teach a method as claimed in claim 1, further comprising: releasing a packet data session if a user equipment does not handover to the second communication network within a predetermined time thus requiring the user equipment to repeat the authentication procedure if the user equipment is moving towards the second communication network for a specified time (i.e., a gap in coverage) (**section 4.2.1**).

Consider **claim 8** and **as applied to claim 1 above**, Parikh et al. teach a method as claimed in claim 1, further comprising: (i) sending by a user equipment a handover trigger indication to a gateway node in the second communication network, wherein the handover trigger indication comprises user equipment identification parameters and a packet data protocol profile (**section 4.1 and figure 4**); (ii) sending by a gateway node the user equipment identification parameters and the packet data protocol profile to a serving node in the second cellular communication network (**section 4.1 and figure 4**); (iii) contacting by the serving node a home location register to obtain user equipment authentication parameters (**section 4.1 and figure 4**); (iv) sending by the serving node a packet data protocol profile request to the gateway

Art Unit: 2617

node (**section 4.1 and figure 4**); (v) responding by sending by the gateway node a packet data protocol profile response to the serving node(**section 4.1 and figure 4**); (vi) sending by the serving node authentication information to the gateway node(**section 4.1 and figure 4**); (vii) sending the gateway node the authentication information to the user equipment(**section 4.1 and figure 4**); (viii) authenticating by the user equipment the second communication network(**section 4.1 and figure 4**); (ix) sending by the user equipment a response to the serving node and moving the user equipment into the second cellular communication network(**section 4.1 and figure 4**);

Consider **claim 9** and as applied to **claim 1** above, Parikh et al. clearly show and disclose a method as claimed in claim 1, further comprising: (i) sending by a user equipment a handover trigger indication to a gateway node in the second communication network(**section 4.1 and figure 4**); (ii) sending by the gateway node a protocol data unit notification request to a serving node in the second communication network(**section 4.1 and figure 4**); (iii) contacting by the serving node a home location register (i.e., HA) to obtain user equipment authentication parameters(**section 4.1 and figure 4**); (iv) sending by the serving node a proxy authentication and a ciphering request to the gateway node(**section 4.1 and figure 4**); (v) converting by the gateway node authentication information in the ciphering request which is then sent to the user equipment(**section 4.1 and figure 4**); (vi) responding by the user equipment with an authentication message which is sent to the gateway node(**section 4.1 and figure 4**); (vii) converting by the gateway node the authentication message from the user equipment and sending a proxy authentication and a ciphering response to the serving node(**section 4.1 and figure 4**); (viii) sending by the serving node a protocol data unit notification response to the gateway node(**section 4.1 and figure 4, conclusion**); (ix) sending by the serving node a create packet data

Art Unit: 2617

protocol request to the gateway node(**section 4.1 and figure 4, conclusion**) (i.e., see “network initiated bearer setup”); (x) sending by the gateway node a create packet data protocol response to the serving node(**section 4.1 and figure 4, conclusion**) (i.e., see “network initiated bearer setup”); and (xi) replying by the gateway node to the handover trigger indication sent by the user equipment by sending a handover trigger response to the user equipment(**section 4.1 and figure 4**).

Consider **claim 10**, Parikh et al. clearly show and disclose a method for ensuring continuity of a communication session, the method comprising: handing over by a user equipment from a first communication network (i.e., WLAN) (**figures 1 and 2**) to a second cellular communication network (IMT-2000 Radio Network) (**figures 1 and 2**), and when the user equipment hands over from the first communication network to the second communication network (**section 4.1 and figure 4**), maintaining an attachment of the user equipment to the first communication network after the user equipment moves away from a coverage area of the first communication network for a predetermined time in order to allow the user equipment to return to the first communication network without having to repeat an authentication procedure and a packet data session establishment procedure before handing over to the second network (i.e., this prevents the spurious handoff triggers) (**sections 3.3- 4.2.1**).

Consider **claim 11** and as **applied to claim 10 above**, Parikh et al. teach a method as claimed in claim 10, further comprising: releasing a packet data session if the user equipment does not handover to the second cellular communication network within the predetermined time thus requiring the user equipment to repeat the authentication procedure if the user equipment is moving towards the second communication network for a specified time (i.e., a gap in coverage

and other areas for potential spurious handoff triggers) (**section 4.2.1**).

Consider **claim 12** and **as applied to claim 10 above**, Parikh et al. teach a method as claimed in claim 1, further comprising: (i) sending by a user equipment a handover trigger indication to a gateway node in the second communication network, wherein the handover trigger indication comprises user equipment identification parameters and a packet data protocol profile (**section 4.1 and figure 4**); (ii) sending by a gateway node the user equipment identification parameters and the packet data protocol profile to a serving node in the second cellular communication network (**section 4.1 and figure 4**); (iii) contacting by the serving node a home location register to obtain user equipment authentication parameters (**section 4.1 and figure 4**); (iv) sending by the serving node a packet data protocol profile request to the gateway node (**section 4.1 and figure 4**); (v) responding by sending by the gateway node a packet data protocol profile response to the serving node (**section 4.1 and figure 4**); (vi) sending by the serving node authentication information to the gateway node (**section 4.1 and figure 4**); (vii) sending the gateway node the authentication information to the user equipment (**section 4.1 and figure 4**); (viii) authenticating by the user equipment the second cellular communication network (**section 4.1 and figure 4**); and (ix) sending by the user equipment a response to the serving node and moving the user equipment into the second communication network (**section 4.1 and figure 4**);

Consider **claim 13** and **as applied to claim 10 above**, Parikh et al. teach a method as claimed in claim 1, further comprising: (i) sending by a user equipment a handover trigger indication to a gateway node in the second communication network (**section 4.1 and figure 4**); (ii) sending by the gateway node a protocol data unit notification request to a serving node in the

Art Unit: 2617

second cellular communication network(**section 4.1 and figure 4**); (iii) contacting by the serving node a home location register to obtain user equipment authentication parameters(**section 4.1 and figure 4**); (iv) sending by the serving node a proxy authentication and a ciphering request to the gateway node(**section 4.1 and figure 4**); (v) converting by the gateway node authentication information in the ciphering request which is then sent to the user equipment(**section 4.1 and figure 4**); (vi) responding by the user equipment with an authentication message which is sent to the gateway node(**section 4.1 and figure 4**); (vii) converting by the gateway node the authentication message from the user equipment and sending a proxy authentication and a ciphering response to the serving node(**section 4.1 and figure 4**); (viii) sending by the serving node a protocol data unit notification response to the gateway node(**section 4.1 and figure 4, conclusion**); (ix) sending by the serving node a create packet data protocol request to the gateway node(**section 4.1 and figure 4**) (i.e., see “network initiated bearer setup”); (x) sending by the gateway node a create packet data protocol response to the serving node(**section 4.1 and figure 4, conclusion**) (i.e., see “network initiated bearer setup”); and (xi) replying by the gateway node to the handover trigger indication sent by the user equipment by sending a handover trigger response to the user equipment(**section 4.1 and figure 4**).

Consider **claim 14**, Parikh et al. clearly show and disclose a communication system (**abstract and introduction**) comprising: a user equipment; a first communication network and a second cellular communication network, the system being configured to enable continuity of a communication session when a user equipment moves from a coverage area of the first communication network to a coverage area of a second cellular communication network (**abstract, introduction, section 4.1 and figure 4**), and to simultaneously perform an

Art Unit: 2617

authentication procedure for a packet data session with the second cellular communication network and a packet data protocol session establishment procedure with the second cellular communication network, while the user equipment is still attached to the first communication network(**abstract , introduction, section 4.1 and figure 4.**

Consider **claim 15**, Parikh et al. teach the communication system (**figures 1-4**) for ensuring continuity of a communication session when a user equipment hands over from a first communication network to a second cellular communication network (**abstract and introduction**), the communication system comprising: first performing means for performing an authentication procedure for a packet data session with a second communication network while still being attached to a first communication network (**abstract , introduction, section 4.1 and figure 4**); and second performing means for simultaneously perform a packet data protocol session establishment procedure with the second cellular communication network while still being attached to the first communication network(**abstract , introduction, section 4.1 and figure 4**).

Consider **claim 16**, Parikh et al. teach the communication system (**figures 1-4**), comprising an authentication unit configured to conduct an authentication procedure for a packet data session between a first and second communication networks when a user equipment hands off from the first communication network to the second communication network (**abstract , introduction, section 4.1 and figure 4**), the authentication procedure being conducted while the user equipment is still attached to a first communication network(**abstract , introduction, section 4.1 and figure 4**); and an establishment unit configured to simultaneously performing a packet data session establishment procedure with the second communication network while still

being attached to the first communication network(**abstract , introduction, section 4.1 and figure 4**).

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Gao et al. US Patent Pub. No: 2004/0067754 A1 teaches the claimed in invention see at least paragraphs 0033-0047)

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Charles Shedrick whose telephone number is (571)-272-8621. The examiner can normally be reached on Monday thru Friday 8:00AM-4:30PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kincaid Lester can be reached on (571)-272-7922. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
